

Executive Decision Report & Capstone

Retail Business Intelligence Dashboard

01 | Executive Summary

A concise view of business performance, opportunity areas, and decisions.

Business context The analysis uses retail transaction data to understand sales, orders, profitability, customer behavior, returns, payment methods, and regional performance.	Decision objective Convert dashboard findings into practical actions that improve revenue visibility, protect profit, and strengthen customer experience.
---	---

The dashboard provides a single view of commercial performance. It combines headline KPIs with category, region, gender, payment, return, and time-based analysis. The recommended actions focus on improving the use of high-performing categories, reducing avoidable returns, and strengthening regional and payment-channel decisions.

Executive takeaways

- Sales performance is concentrated in a small number of product categories, creating a clear focus area for inventory and marketing.
- Regional performance is relatively strong in the leading regions, supporting targeted regional campaigns and stock planning.
- Returned orders represent a measurable operational risk and should be tracked with delivery and customer-service indicators.
- Payment-method analysis can guide channel optimization and customer convenience initiatives.

02 | KPI Snapshot

Headline measures from the current retail dataset and Power BI dashboard.

What the KPIs tell us	How executives can use them
The dashboard distinguishes reported total amount from calculated sales and estimated profit. This makes it possible to compare the source transaction value with derived business measures.	Use the KPI cards as the first checkpoint in every monthly review. Investigate changes by category, region, payment method, and return status before taking action.

03 | Methodology & Analytical Approach

The workflow connects data preparation, exploration, dashboarding, and executive decision-making.

Step	Activity	Output
1	Data preparation	Clean dataset with standardized fields and derived measures
2	Exploratory analysis	Descriptive statistics, distributions, correlations, and comparisons
3	Power BI dashboard	Interactive KPI cards, charts, and slicers
4	Business interpretation	Drivers, risks, and strategic opportunities
5	Executive report	Recommendations, ROI scenario, and implementation timeline

Analytical principle

The report separates observed dashboard values from forward-looking assumptions. Historical metrics describe what happened; the ROI section is an illustrative planning scenario and should be validated with actual campaign costs, operational baselines, and finance approval.

04 | Key Revenue Drivers

Category and regional patterns identify where management attention should be concentrated.

Category performance

- Electronics is the leading category in the displayed sales analysis, followed by Home and Sports.
- The leading categories should receive priority in inventory availability, promotional planning, and margin review.
- Lower-volume categories should not automatically be discontinued; assess margin, strategic importance, and customer acquisition value first.

Regional performance

- South and North appear among the stronger regions in the dashboard comparison.
- Regional campaigns should be adapted to local demand rather than applying one identical promotion everywhere.
- Use region-level sales, return rate, delivery time, and payment preference together for a more complete decision.

Driver	Observed dashboard signal	Management response
Product category	Sales are concentrated in selected categories.	Protect availability and test targeted promotions.
Region	Regional sales levels differ.	Allocate stock and campaigns by regional demand.
Payment method	Credit Card and Debit Card are prominent channels.	Maintain reliability and reduce payment friction.

05 | Customer & Payment Insights

Customer mix and payment behavior support more targeted commercial decisions.

Customer gender contribution

The dashboard shows a near-balanced contribution from Female and Male customers, with a smaller Other segment. This suggests that broad customer coverage matters, while campaigns can still be personalized by category, region, and purchase behavior.

Payment method contribution

- Credit Card and Debit Card are the largest payment channels in the displayed chart.
- UPI, COD, PayPal, and Wallet also contribute meaningful transaction value and should remain part of the payment experience.
- Payment performance should be reviewed using success rate, cancellation rate, refund time, and customer satisfaction—not only sales value.

Decision area	Recommended measure	Why it matters
Customer targeting	Sales by category × gender × region	Improves campaign relevance and budget allocation.
Payment optimization	Sales, success rate, refunds, and failures by method	Reduces friction and protects completed orders.
Customer experience	Returns, delivery time, and complaint reasons	Connects operational quality to repeat purchase potential.

06 | Risk Areas & Control Priorities

The dashboard highlights areas that require regular monitoring.

Risk	Potential business impact	Control / monitoring action
Product returns	Revenue leakage, reverse logistics cost, customer dissatisfaction	Track return rate by category, region, delivery time, and payment method.
Margin visibility	High sales may not translate into sustainable profit	Review estimated profit and margin by category and region.
Regional imbalance	Stock-outs in strong regions or inefficient spend in weak regions	Use regional sales and inventory planning together.
Payment friction	Failed or abandoned transactions	Monitor payment success, refund time, and channel reliability.

Priority control

Create a monthly risk review that combines return rate, estimated profit, delivery performance, and payment outcomes. This prevents management from relying on sales value alone.

07 | Three Strategic Recommendations

Actionable decisions linked directly to the dashboard findings.

01

Focus on high-performing categories

Protect inventory availability in leading categories and run targeted promotions based on region and customer mix.

02

Reduce avoidable returns

Create a return-reason dashboard by category, region, delivery time, and payment method; investigate the largest contributors first.

03

Optimize regional and payment strategy

Use regional sales patterns and payment-channel contribution to tailor campaigns, stock allocation, and checkout improvements.

Decision rule

Start with actions that are measurable, reversible, and linked to a dashboard KPI. Review results after the first operating cycle before scaling the initiative.

08 | Illustrative ROI Projection

Planning scenario only — validate assumptions with finance and operational owners.

Initiative	Illustrative annual benefit	Illustrative investment	Illustrative net benefit
Category-focused campaigns	■6,00,000	■2,00,000	■4,00,000
Return reduction program	■5,00,000	■1,50,000	■3,50,000
Regional/payment optimization	■4,00,000	■1,25,000	■2,75,000
Total scenario	■15,00,000	■4,75,000	■10,25,000

Interpretation

- The scenario indicates how a portfolio of initiatives could be evaluated using benefit, investment, and net benefit.
- These figures are illustrative and are not measured results or a financial guarantee.
- Before approval, replace the assumptions with actual campaign budgets, return costs, baseline conversion, and finance-approved benefit estimates.

09 | Implementation Timeline

A practical 90-day rollout with clear ownership and measurable checkpoints.

Phase	Timeline	Key activities	Success measure
Diagnose	Days 1–15	Validate KPIs, identify top categories, map return reasons, confirm baseline metrics.	Approved baseline and priority list
Pilot	Days 16–45	Run one category campaign, test return-reduction action, review payment friction.	Pilot results and lessons learned
Scale	Days 46–75	Expand successful actions to selected regions and channels.	Improved KPI movement vs baseline
Review	Days 76–90	Evaluate ROI, document controls, and set monthly governance.	Executive go/no-go decision

Suggested ownership

- Business team: category and regional campaign decisions.
- Operations team: return and delivery improvement.
- Finance team: ROI validation and profitability review.
- Analytics team: dashboard refresh, KPI monitoring, and executive reporting.

10 | Dashboard & Portfolio Evidence

The Power BI dashboard supports interactive exploration and mentor evaluation.

Evidence item	What it demonstrates
KPI cards	Total Sales, Total Orders, Calculated Sales, and Estimated Profit at a glance.
Category and region charts	Revenue concentration and regional comparison.
Monthly trend	Changes in sales over time.
Return analysis	Returned vs non-returned order contribution.
Payment analysis	Sales contribution by payment method.
Scatter chart and slicers	Relationship exploration and interactive filtering by category and region.

Portfolio contents

- Task 2: KPI Dictionary and Data Quality Contract
- Task 3: Data Ingestion, Cleaning, and Preprocessing
- Task 4: Exploratory Data Analysis and Statistical Insights
- Task 5: Interactive Business Dashboard
- Task 6: Executive Decision Report and Capstone Presentation

11 | Final Decision Summary

The recommended next step is a controlled pilot supported by consistent KPI governance.

Recommended decision

Approve a 90-day pilot that combines category-focused commercial activity, return-reduction analysis, and regional/payment optimization. Use the Power BI dashboard as the common monitoring layer.

Required before scale-up

Confirm financial baselines, assign business owners, validate ROI assumptions, and review KPI movement against the pre-pilot baseline.

Conclusion

This capstone demonstrates the complete analytics-to-decision workflow: preparing data, exploring business patterns, building an interactive dashboard, and translating findings into measurable strategic actions. The portfolio is designed to support transparent, data-driven management decisions.
